Abstract A manageability model integrates the notion of the resource's life cycle into a model definition. Thus, for example, the resource life cycle may include a number of representative stages: before in-hand before installed, while installing, while binding, before operational, and while operational. In a representative embodiment, the manageability model for an object comprises a set of properties, a set of property categories into which the set of properties are organized, and at least one category characteristic for a given property category. The category characteristic includes a qualifier having values identifying phases within a life cycle of the resource. During management, attributes of the object are classified according to phases of a life cycle of the resource. During a given management operation, an operational state of the resource is then identified. Depending on the operational state identified, a given constraint is then applied to the management operation.
